

One platform for all your print, scan and device management

Incorporating uniFLOW into your document processes will enhance control and efficiency of multifunctional devices. The server-based solution provides one platform which meets the challenges of various areas including office printing, document scanning, mobile printing and device management. Its connection to uniFLOW Online transforms an organization's traditional server-based print and scan environment into a highly flexible hybrid system which matches dedicated server hardware with its public cloud services.

What is uniFLOW?

uniFLOW's modular system architecture creates a holistic print, scan and device management solution suitable for organizations of all sizes. The 'One Platform' principle, together with a powerful feature set, allows the system to be tailored to meet specific business requirements and can grow to accommodate future business needs. As organizations shape

their cloud strategy, they increasingly seek to mix and match the best technologies that are available. uniFLOW provides flexibility, cost advantages and, as a device-independent platform, simplifies assimilation of a mixed fleet environment.

What makes uniFLOW unique?

Hybrid connection to the cloud

uniFLOW's hybrid technology combines the best of both worlds- server and cloud. The processing power of local servers can still be used while central management of the print and scan environment is based in the cloud. This also offers fast and easy scalability options without the need for additional servers. Locations that do not need a server can, over time, be moved to the cloud.

Innovative technologies

A key element of uniFLOW's one platform strategy is the uniFLOW Universal Driver providing a single universal print queue for all secure and mobile printing. The combination of the patented uniFLOW Universal Driver concept and embedded applets for a wide variety of vendors, including Canon, Xerox, Konica Minolta, Lexmark, Samsung, Sharp, OKI, Brother and EPSON as well as the certified Apple AirPrint® and Mopria™ service, provide a unique print environment in which just a single driver is required for the entire fleet and all incoming print jobs. In addition, its end-to-end resilience strategy does not rely on 3rd party software or costly hardware, while securing all print jobs, and ensures system availability.

When using Windows Modern Print platform, you can submit print jobs with uniFLOW's Printer app which adheres to Microsoft's latest security standards.

Intelligent document scanning processes

uniFLOW optimizes document processes by capturing documents from various sources, then automatically processes and distributes them to a wide variety of destinations. Intelligent print and scan auditing processes safeguard organizations' intellectual property. Workflows can be fine-tuned using the powerful Workflow Editor. The administrator can stipulate which workflows can be accessed by each department or user.

Reduce cost uniFLOW offers numerous features which help reduce printing and copying costs. Costs are made visible and rules, as well as policies, can be enforced resulting in direct savings. Purchasing and implementation costs are recoverable within months after implementation.	Increase security Document security is paramount to avoid data breaches, theft of intellectual property or confidential documents falling into the wrong hands. uniFLOW ensures document security.	Improve productivity Managing business processes with uniFLOW enhances usability and makes processes much more productive. Helping users to be more efficient with print and scan processes allows them to focus on core tasks and therefore increasing overall profitability.
